# Introduction

Resizer is a software, that will help you in creating as many sizes of your pictures as you want, with few clicks. It supports png and jpg files. Program will automatically scale image to given size. It works with horizontal and vertical images.

Machine requirements:

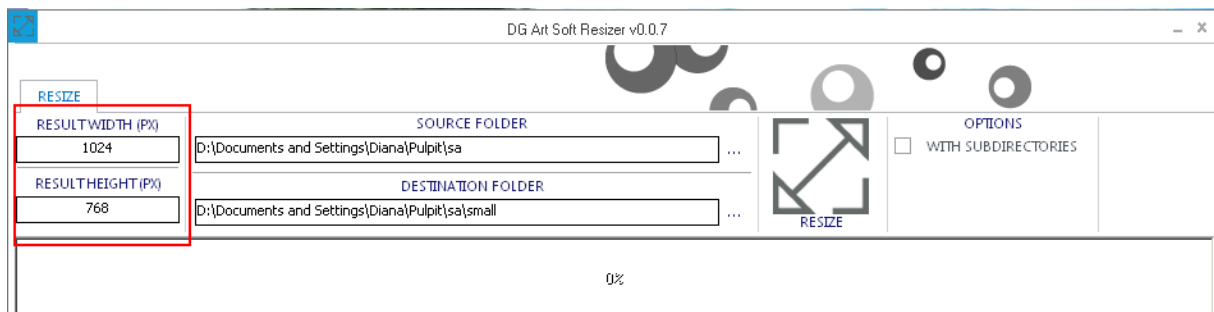

- Windows XP or newer.
- .NET Framework 4.0 or newer.
- RAM depends on project size. But 2GB is enough for common projects.

## Common usage

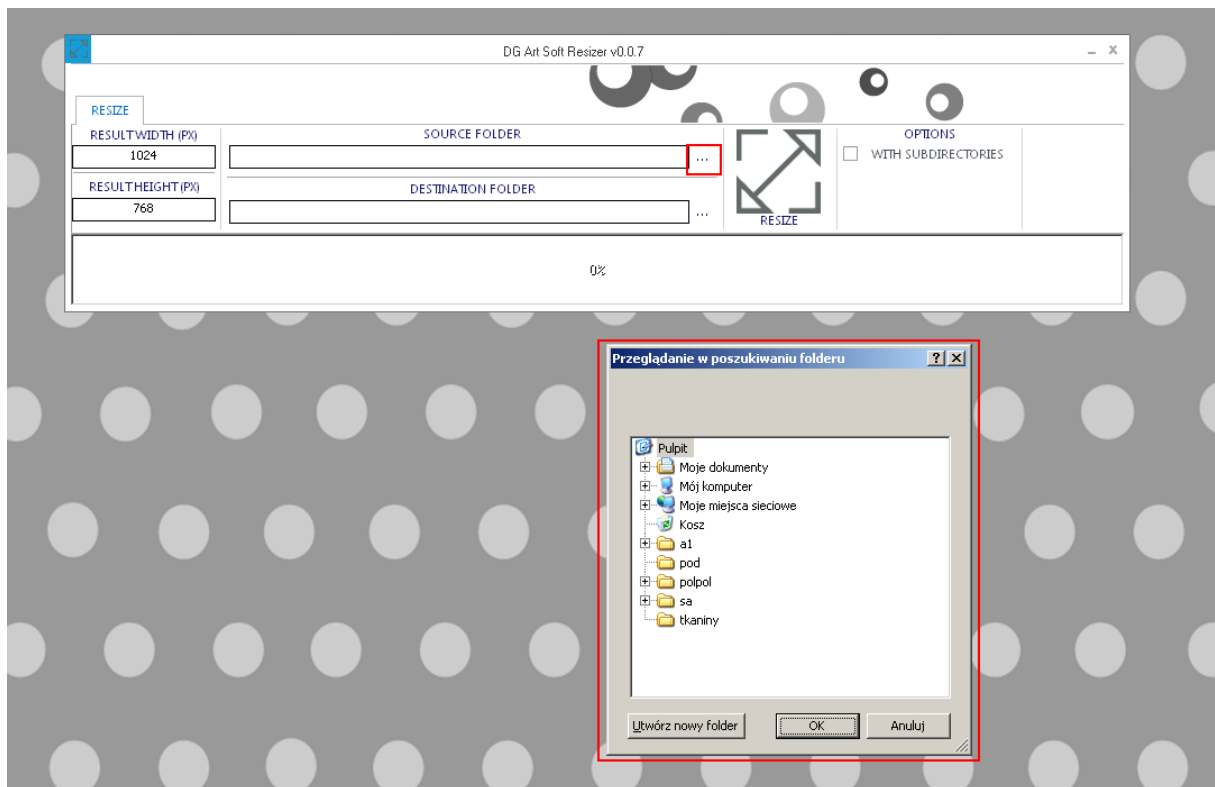

Common usage is when you select source and destination directories and click on RESIZE button.

To perform common resizing follow below steps:

1. Put RESULT WIDTH in pixels.
2. PUT RESULT HEIGHT in pixels.

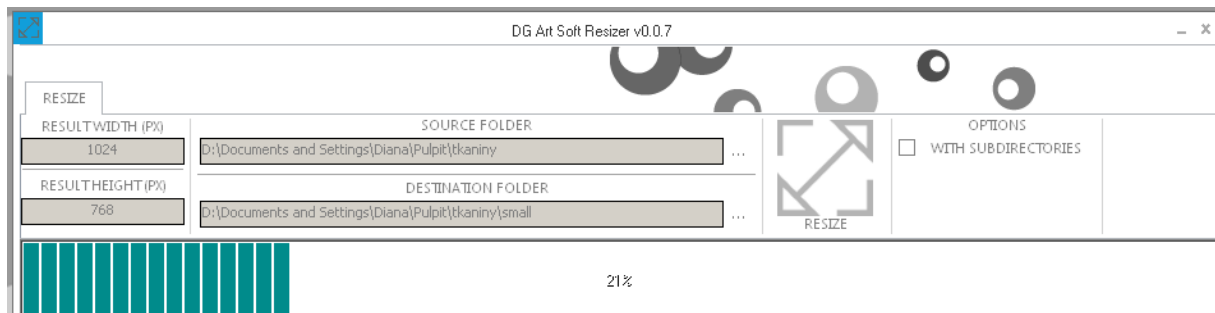

### 3. Select SOURCE FOLDER.

### 4. (OPTIONAL) Select DESTINATION FOLDER.

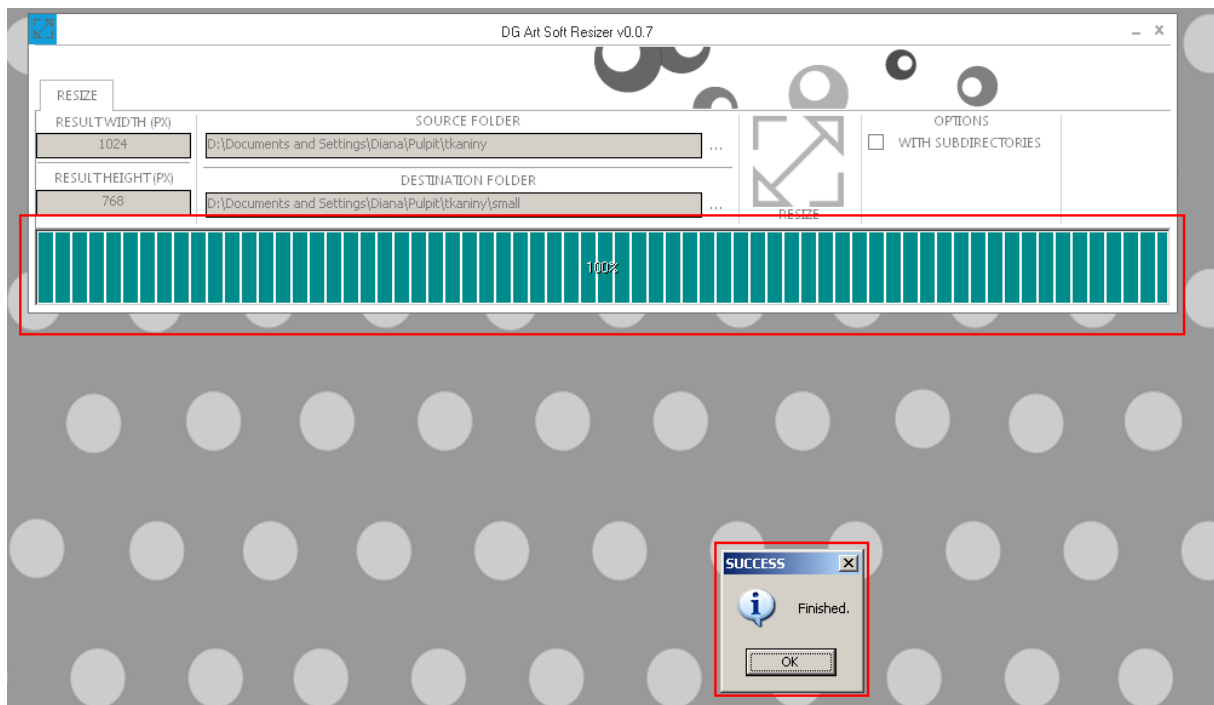

### 5. Click on RESIZE.

You will observe progress of images resizing.

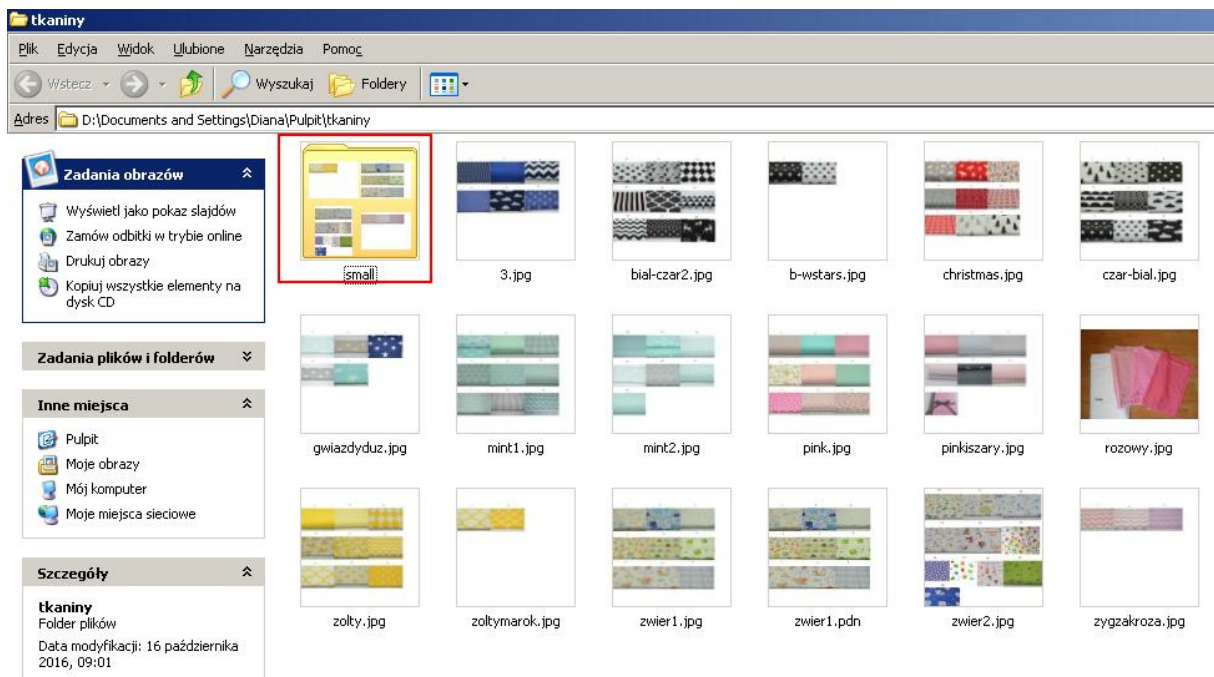

It doesn't matter, if your images are mixed horizontally and vertically in same directory. Resizer will handle this correctly.

After successful work, you will see SUCCESS message.

You can see result in DESTINATION FOLDER

# Preserve folder structure

This mode is useful, when you want to do mass resizing of many pictures which are located in hierarchical structures (folders, subfolders).

Resizer can handle such situation and preserve folder structure in DESTINATION FOLDER.

To perform such task just select WITH SUBDIRECTORIES option.
